Motivation

## Equational Theories, Reformulations of Notions

## Unification Type, Kinds of Unification

## Results for Specific Theories

## General Results

## Motivation

- Unifications algorithms are essential components for deduction systems.
- Simple integration of axioms that describe the properties of equality often leads to an unacceptable increase of search space.
- Proposed solution: To build equational axioms into inference, replacing syntactic unification with equational unification.

## Motivation

## Example

Given: Al-theory $\{f(f(x, y), z) \approx f(x, f(y, z)), f(x, x) \approx x\}$. Apply idempotence to the term

$$
f\left(x_{0}, f\left(x_{1}, \ldots, f\left(x_{n-1}, f\left(x_{n}, f\left(x_{0}, \ldots, f\left(x_{n-1}, x_{n}\right) \ldots\right)\right)\right) \ldots\right)\right)
$$

## Motivation

## Example

Given: Al-theory $\{f(f(x, y), z) \approx f(x, f(y, z)), f(x, x) \approx x\}$. Apply idempotence to the term

$$
f\left(x_{0}, f\left(x_{1}, \ldots, f\left(x_{n-1}, f\left(x_{n}, f\left(x_{0}, \ldots, f\left(x_{n-1}, x_{n}\right) \ldots\right)\right)\right) \ldots\right)\right)
$$

- Exponentially many ways of rearranging the parentheses with the help of associativity: Very time consuming if the prover has to search for the right one.

## Motivation

## Example

Given: Al-theory $\{f(f(x, y), z) \approx f(x, f(y, z)), f(x, x) \approx x\}$. Apply idempotence to the term

$$
f\left(x_{0}, f\left(x_{1}, \ldots, f\left(x_{n-1}, f\left(x_{n}, f\left(x_{0}, \ldots, f\left(x_{n-1}, x_{n}\right) \ldots\right)\right)\right) \ldots\right)\right)
$$

- Exponentially many ways of rearranging the parentheses with the help of associativity: Very time consuming if the prover has to search for the right one.
- A human mathematician would use words instead of terms, i.e. would work modulo associativity, and apply idempotence $x x=x$ to the word $x_{0} \cdots x_{n} x_{0} \cdots x_{n}$ by unifying $x$ with $x_{0} \cdots x_{n}$.

## Motivation

Example
Given: Al-theory $\{f(f(x, y), z) \approx f(x, f(y, z)), f(x, x) \approx x\}$. Apply idempotence to the term

$$
f\left(x_{0}, f\left(x_{1}, \ldots, f\left(x_{n-1}, f\left(x_{n}, f\left(x_{0}, \ldots, f\left(x_{n-1}, x_{n}\right) \ldots\right)\right)\right) \ldots\right)\right)
$$

- Exponentially many ways of rearranging the parentheses with the help of associativity: Very time consuming if the prover has to search for the right one.
- A human mathematician would use words instead of terms, i.e. would work modulo associativity, and apply idempotence $x x=x$ to the word $x_{0} \cdots x_{n} x_{0} \cdots x_{n}$ by unifying $x$ with $x_{0} \cdots x_{n}$.
- To adopt this way of proceeding for a prover, we must replace the syntactic unification algorithm in the resolution step by associative unification.

## Outline

## Motivation

Equational Theories, Reformulations of Notions

## Unification Type, Kinds of Unification

Results for Specific Theories

## General Results

## Equational Theory

## Equational Theory

- $E$ : a set of equations over $\mathcal{T}(\mathcal{F}, \mathcal{V})$, called identities.
- Equational theory $\doteq_{E}$ defined by $E$ : The least congruence relation on $\mathcal{T}(\mathcal{F}, \mathcal{V})$ closed under substitution and containing $E$

## Equational Theory

## Equational Theory

- $E$ : a set of equations over $\mathcal{T}(\mathcal{F}, \mathcal{V})$, called identities.
- Equational theory $\doteq_{E}$ defined by $E$ : The least congruence relation on $\mathcal{T}(\mathcal{F}, \mathcal{V})$ closed under substitution and containing $E$
i.e., $\dot{=}_{E}$ is the least binary relation on $\mathcal{T}(\mathcal{F}, \mathcal{V})$ with the properties:
- $E \subseteq \dot{\bar{A}}_{E}$.
- Reflexivity: $s \dot{=}_{E} s$ for all $s$.
- Symmetry: If $s \doteq_{E} t$ then $t \doteq_{E} s$ for all $s, t$.
- Transitivity: If $s \doteq_{E} t$ and $t \doteq_{E} r$ then $s \doteq_{E} r$ for all $s, t, r$.
- Congruence: If $s_{1} \dot{=}_{E} t_{1}, \ldots, s_{n} \dot{\bar{L}}_{E} t_{n}$ then $f\left(s_{1}, \ldots, s_{n}\right) \doteq_{E} f\left(t_{1}, \ldots, t_{n}\right)$ for all $s, t, n$ and $n$-ary $f$.
- Closure under substitution: If $s \doteq_{E} t$ then $s \sigma \dot{\doteq}_{E} t \sigma$ for all $s, t, \sigma$.

## Notation, Terminology

- Identities: $s \approx t$.
- $s \dot{=}_{E} t$ : The term $s$ is equal modulo $E$ to the term $t$.
- $E$ will be called an equational theory as well (abuse of the terminology).
- $\operatorname{sig}(E)$ : The set of function symbols that occur in $E$.

## Example

- $C:=\{f(x, y) \approx f(y, x)\}: f$ is commutative. $\operatorname{sig}(C)=f$.
- $f(f(a, b), c) \doteq_{c} f(c, f(b, a))$.
- $A U:=\{f(f(x, y), z) \approx f(x, f(y, z)), f(x, e) \approx x$, $f(e, x) \approx x\}: f$ is associative, $e$ is unit.
$\operatorname{sig}(A U)=\{f, e\}$
- $f(a, f(x, f(e, a))) \doteq_{A U} f(f(a, x), a)$.

## Notation, Terminology

## E-Unification Problem, E-Unifier, E-Unifiability

- E: equational theory.
$\mathcal{F}$ : set of function symbols.
$\mathcal{V}$ : countable set of variables.
- E-Unification problem over $\mathcal{F}$ : a finite set of equations

$$
\Gamma=\left\{s_{1} \doteq_{E}^{?} t_{1}, \ldots, s_{n} \doteq_{E}^{?} t_{n}\right\},
$$

where $s_{i}, t_{i} \in \mathcal{T}(\mathcal{F}, \mathcal{V})$.

- $E$-Unifier of $\Gamma$ : a substitution $\sigma$ such that

$$
s_{1} \sigma \doteq \doteq_{E} t_{1} \sigma, \ldots, s_{n} \sigma \doteq_{E} t_{n} \sigma .
$$

- $u_{E}(\Gamma)$ : the set of $E$-unifiers of $\Gamma$. $\Gamma$ is $E$-unifiable iff $u_{E}(\Gamma) \neq \emptyset$.

## E-Unification vs Syntactic Unification

- Syntactic unification: a special case of $E$-unif. with $E=\emptyset$.
- Any syntactic unifier of an $E$-unification problem $\Gamma$ is also an $E$-unifier of $\Gamma$.
- For $E \neq \emptyset, u_{E}(\Gamma)$ may contain a unifier that is not a syntactic unifier.

## E-Unification vs Syntactic Unification

- Syntactic unification: a special case of $E$-unif. with $E=\emptyset$.
- Any syntactic unifier of an $E$-unification problem $\Gamma$ is also an $E$-unifier of $\Gamma$.
- For $E \neq \emptyset, u_{E}(\Gamma)$ may contain a unifier that is not a syntactic unifier.

## Example

- Terms $f(a, x)$ and $f(b, y)$ :
- Not syntactically unifiable.
- Unifiable module commutativity of $f$.

C-unifier: $\{x \mapsto b, y \mapsto a\}$

## E-Unification vs Syntactic Unification

- Syntactic unification: a special case of $E$-unif. with $E=\emptyset$.
- Any syntactic unifier of an $E$-unification problem $\Gamma$ is also an $E$-unifier of $\Gamma$.
- For $E \neq \emptyset, u_{E}(\Gamma)$ may contain a unifier that is not a syntactic unifier.

## Example

- Terms $f(a, x)$ and $f(b, y)$ :
- Not syntactically unifiable.
- Unifiable module commutativity of $f$.

C-unifier: $\{x \mapsto b, y \mapsto a\}$

- Terms $f(a, x)$ and $f(y, b)$ :
- Have the most general syntactic unifier $\{x \mapsto b, y \mapsto a\}$.
- If $f$ is associative, then $u_{A}\left(\left\{f(a, x) \doteq_{A}^{?} f(y, b)\right\}\right)$ contains additional $A$-unifiers, e.g. $\{x \mapsto f(z, b), y \mapsto f(a, z)\}$.

## Notions Adapted

## Instantiation Quasi-Ordering (Modified)

- E: equational theory. $\mathcal{X}$ : set of variables.
- A substitution $\sigma$ is more general modulo $E$ on $\mathcal{X}$ than $\vartheta$, written $\sigma \leq_{E}^{\mathcal{X}} \vartheta$, if there exists $\eta$ such that $x \sigma \eta \doteq_{E} X \vartheta$ for all $x \in \mathcal{X}$.
- $\vartheta$ is called an $E$-instance of $\sigma$ modulo $E$ on $\mathcal{X}$.
- The relation $\leq_{E}^{\mathcal{X}}$ is quasi-ordering, called instantiation quasi-ordering.
- $=\mathcal{X}_{E}^{\mathcal{X}}$ is the equivalence relation corresponding to $\leq \frac{\mathcal{X}}{\mathcal{X}}$.

## No Single MGU

- When comparing unifiers of $\Gamma$, the set $\mathcal{X}$ is $\operatorname{vars}(\Gamma)$.
- Unifiable $E$-unification problems might not have an mgu.

## Example

- $f$ is commutative.
- $\Gamma=\left\{f(x, y) \doteq{ }_{C}^{?} f(a, b)\right\}$ has two $C$-unifiers:

$$
\begin{aligned}
\sigma_{1} & =\{x \mapsto a, y \mapsto b\} \\
\sigma_{2} & =\{x \mapsto b, y \mapsto a\}
\end{aligned}
$$

- On vars $(\Gamma)=\{x, y\}$, any unifier is equal to either $\sigma_{1}$ or $\sigma_{2}$.
- $\sigma_{1}$ and $\sigma_{2}$ are not comparable wrt $\leq_{C}^{\{x, y\}}$.
- Hence, no mgu for $\Gamma$.

## MCSU vs MGU

In $E$-unification, the role of mgu is taken on by a complete set of $E$-unifiers.

## Complete and Minimal Complete Sets of $E$-Unifiers

- 「: E-unification problem over $\mathcal{F}$.
- $\mathcal{X}=\operatorname{vars}(\Gamma)$.
- $\mathcal{C}$ is a complete set of $E$-unifiers of $\Gamma$ iff

1. $\mathcal{C} \subseteq u_{E}(\Gamma)$ : $\mathcal{C}$ 's elements are $E$-unifiers of $\Gamma$, and
2. For each $\vartheta \in u_{E}(\Gamma)$ there exists $\sigma \in \mathcal{C}$ such that $\sigma \leq \underset{E}{\mathcal{X}} \vartheta$.

- $\mathcal{C}$ is a minimal complete set of $E$-unifiers $\left(m c s u_{E}\right)$ of $\Gamma$ if it is a complete set of $E$-unifiers of $\Gamma$ and

3. two distinct elements of $\mathcal{C}$ are not comparable wrt $\underset{E}{\mathcal{X}}$.

- $\sigma$ is an mgu of $\Gamma$ iff $\operatorname{mcsu}_{E}(\Gamma)=\{\sigma\}$.

## MCSU's

- $\operatorname{mcsu}_{E}(\Gamma)=\emptyset$ if $\Gamma$ is not $E$-unifiable.
- Minimal complete sets of unifiers do not always exist.
- When they exist, they may be infinite.
- When they exist, they are unique up to $=\frac{\mathcal{X}}{\mathcal{E}}$.

## Outline

## Motivation

## Equational Theories, Reformulations of Notions

Unification Type, Kinds of Unification

## Results for Specific Theories

## General Results

## Unification Type

## Unification Type of a Problem, Theory.

- $E$ : equational theory.
- 「: E-unification problem over $\mathcal{F}$.- 「 has unification type
- unitary, if $m \operatorname{csu}(\Gamma)$ has cardinality at most one,
- finitary, if $\operatorname{mcsu(\Gamma )\text {hasfinitecardinality,}}$
- infinitary, if $m c s u(\Gamma)$ has infinite cardinality,
- zero, if $m c s u(\Gamma)$ does not exist.
- Abbreviation: type unitary - 1, finitary - $\omega$, infinitary - $\infty$, zero-0.
- Ordering: $1<\omega<\infty<0$.
- Unification type of $E$ wrt $\mathcal{F}$ : the maximal type of an $E$-unification problem over $\mathcal{F}$.

## Unification Type

The unification type of an $E$-equational problem over $\mathcal{F}$ depends both

- on $E$, and
- on $\mathcal{F}$.

Examples and more details will follow.

## Unification Type

## Example (Type Unitary)

Syntactic unification.

- The empty equational theory $\emptyset$ : Syntactic unification.
- Unitary wrt any $\mathcal{F}$ because any unifiable syntactic unification problem has an mgu.

## Unification Type

Example (Type Finitary)
Commutative unification: $\{f(x, y) \approx f(y, x)\}$

- $\left\{f(x, y) \doteq{ }_{c}^{?} f(a, b)\right\}$ does not have an mgu. $C$-unification is not unitary.
- Show that it is finitary for any $\mathcal{F}$ :

## Unification Type

Example (Type Finitary)
Commutative unification: $\{f(x, y) \approx f(y, x)\}$

- $\left\{f(x, y) \doteq{ }_{C}^{?} f(a, b)\right\}$ does not have an mgu. $C$-unification is not unitary.
- Show that it is finitary for any $\mathcal{F}$ :
- Let $\Gamma=\left\{s_{1} \doteq{ }_{C} t_{1}, \ldots, s_{n} \doteq ?\right.$

## Unification Type

Example (Type Finitary)
Commutative unification: $\{f(x, y) \approx f(y, x)\}$

- $\left\{f(x, y) \doteq \doteq_{C} f(a, b)\right\}$ does not have an mgu. $C$-unification is not unitary.
- Show that it is finitary for any $\mathcal{F}$ :
- Let $\Gamma=\left\{s_{1} \doteq ?\right.$
- Consider all possible syntactic unification problems $\Gamma^{\prime}=\left\{s_{1}^{\prime} \doteq^{?} t_{1}^{\prime}, \ldots, s_{n}^{\prime} \doteq^{?} t_{n}^{\prime}\right\}$, where $s_{i}^{\prime} \doteq_{c} s_{i}$ and $t_{i}^{\prime} \doteq_{c} t_{i}$ for each $1 \leq i \leq n$.

## Unification Type

## Example (Type Finitary)

Commutative unification: $\{f(x, y) \approx f(y, x)\}$

- $\left\{f(x, y) \doteq \doteq_{C} f(a, b)\right\}$ does not have an mgu. $C$-unification is not unitary.
- Show that it is finitary for any $\mathcal{F}$ :
- Let $\Gamma=\left\{s_{1} \doteq ?\right.$
- Consider all possible syntactic unification problems $\Gamma^{\prime}=\left\{s_{1}^{\prime} \doteq^{?} t_{1}^{\prime}, \ldots, s_{n}^{\prime} \doteq^{?} t_{n}^{\prime}\right\}$, where $s_{i}^{\prime} \doteq_{c} s_{i}$ and $t_{i}^{\prime} \doteq_{c} t_{i}$ for each $1 \leq i \leq n$.
- There are only finitely many such $\Gamma^{\prime}$ s, because the $C$-equivalence class for a given term $t$ is finite.

## Unification Type

## Example (Type Finitary)

Commutative unification: $\{f(x, y) \approx f(y, x)\}$

- $\left\{f(x, y) \doteq{ }_{C}^{?} f(a, b)\right\}$ does not have an mgu. $C$-unification is not unitary.
- Show that it is finitary for any $\mathcal{F}$ :
- Let $\Gamma=\left\{s_{1} \doteq ?\right.$
- Consider all possible syntactic unification problems $\Gamma^{\prime}=\left\{s_{1}^{\prime} \doteq^{?} t_{1}^{\prime}, \ldots, s_{n}^{\prime} \doteq ? ~ t_{n}^{\prime}\right\}$, where $s_{i}^{\prime} \doteq{ }_{c} s_{i}$ and $t_{i}^{\prime} \doteq_{C} t_{i}$ for each $1 \leq i \leq n$.
- There are only finitely many such $\Gamma^{\prime}$ s, because the $C$-equivalence class for a given term $t$ is finite.
- It can be shown that collection of all mgu's of $\Gamma^{\prime} s$ is a complete set of $C$-unifiers of $\Gamma$. This set if finite.

## Unification Type

## Example (Type Finitary)

Commutative unification: $\{f(x, y) \approx f(y, x)\}$

- $\left\{f(x, y) \doteq \doteq_{C} f(a, b)\right\}$ does not have an mgu. $C$-unification is not unitary.
- Show that it is finitary for any $\mathcal{F}$ :
- Let $\Gamma=\left\{s_{1} \doteq ?\right.$
- Consider all possible syntactic unification problems $\Gamma^{\prime}=\left\{s_{1}^{\prime} \doteq^{?} t_{1}^{\prime}, \ldots, s_{n}^{\prime} \doteq ? ~ t_{n}^{\prime}\right\}$, where $s_{i}^{\prime} \doteq{ }_{c} s_{i}$ and $t_{i}^{\prime} \doteq_{C} t_{i}$ for each $1 \leq i \leq n$.
- There are only finitely many such $\Gamma^{\prime}$ s, because the $C$-equivalence class for a given term $t$ is finite.
- It can be shown that collection of all mgu's of $\Gamma^{\prime} \mathrm{s}$ is a complete set of $C$-unifiers of $\Gamma$. This set if finite.
- If this set is not minimal (often the case), it can be minimized by removing redundant $C$-unifiers.

## Unification Type

## Example (Type Infinitary)

Associative unification: $\{f(f(x, y), z) \approx f(x, f(y, z))\}$.

- $\left\{f(x, a) \doteq{ }_{A}^{?} f(a, x)\right\}$ has an infinite mcsu: $\{\{x \mapsto a\},\{x \mapsto f(a, a)\},\{x \mapsto f(a, f(a, a))\}, \ldots\}$
- Hence, $A$-unification can not be unitary or finitary.
- It is not of type zero because any $A$-unification problem has an mcsu that can be enumerated by the procedure from

圊 G. Plotkin.
Building in equational theories.
In B. Meltzer and D. Michie, editors, Machine
Intelligence, volume 7, pages 73-90. Edinburgh
University Press, 1972.

- A-unification is infinitary for any $\mathcal{F}$.

## Unification Type

Example (Type Zero)
Associative-Idempotent unification:
$\{f(f(x, y), z) \approx f(x, f(y, z)), f(x, x) \approx x\}$.

- $\left\{f(x, f(y, x)) \doteq{ }_{\neq{ }_{A}} f(x, f(z, x))\right\}$ does not have a minimal complete set of unifiers, see
國 F. Baader.
Unification in idempotent semigroups is of type zero. J. Automated Reasoning, 2(3):283-286, 1986.
- Al-unification is of type zero.

## Unification Type. Signature Matters

Associative-commutative unification with unit:
$A C U=\{f(f(x, y), z) \approx f(x, f(y, z)), f(x, y) \approx f(y, x), f(x, e) \approx x\}$.

- Any $A C U$ problem built using only $f$ and variables has an mgu (i.e. is unitary).
- There are $A C U$ problems that contain function symbols other than $f$ and $e$, which are finitary, not unitary. For instance, $\operatorname{mcsu}\left(\left\{f(x, y) \doteq ?{ }_{A C U} f(a, b)\right\}\right)$ consists of four unifiers (which ones?).
Kinds of $E$-unification.

## Kinds of E-Unification

One may distinguish three kinds of $E$-unification problems, depending on the function symbols that are allowed to occur in them.

E-Unification Problems: Elementary, with Constants, General.

- $E$ : an equational Theory. $\Gamma$ : an $E$-unification problem over $\mathcal{F}$.
- $\Gamma$ is an elementary $E$-unification problem iff $\mathcal{F}=\operatorname{sig}(E)$.
- 「 is an $E$-unification problem with constants iff $\mathcal{F} \backslash \operatorname{sig}(E)$ consists of constants.
- $\Gamma$ is a general $E$-unification problem iff $\mathcal{F} \backslash \operatorname{sig}(E)$ may contain arbitrary function symbols.

## Unification Types of Theories wrt Kinds

- Unification type of $E$ wrt elementary unification: Maximal unification type of $E$ wrt all $\mathcal{F}$ such that $\mathcal{F}=\operatorname{sig}(E)$.
- Unification type of $E$ wrt unification with constants: Maximal unification type of $E$ wrt all $\mathcal{F}$ such that $\mathcal{F} \backslash \operatorname{sig}(E)$ is a set of constants.
- Unification type of $E$ wrt general unification: Maximal unification type of $E$ wrt all $\mathcal{F}$ such that $\mathcal{F} \backslash \operatorname{sig}(E)$ is a set of arbitrary function symbols.

## Unification Types of Theories wrt Kinds

The same equational theory can have different unification types for different kinds. Examples:

- ACU (Abelian monoids): Unitary wrt elementary unification, finitary wrt unification with constants and general unification.
- AG (Abelian groups): Unitary wrt elementary unification and unification with constants, finitary wrt general unification.

## Decision and Unification Procedures

- Decision procedure for an equational theory $E$ (wrt $\mathcal{F}$ ): An algorithm that for each $E$-unification problem $\Gamma$ (wrt $\mathcal{F}$ ) returns success if $\Gamma$ is $E$-unifiable, and failure otherwise.

## Decision and Unification Procedures

- Decision procedure for an equational theory $E$ (wrt $\mathcal{F}$ ): An algorithm that for each $E$-unification problem $\Gamma$ (wrt $\mathcal{F}$ ) returns success if $\Gamma$ is $E$-unifiable, and failure otherwise.
- $E$ is decidable if it admits a decision procedure.

## Decision and Unification Procedures

- Decision procedure for an equational theory $E$ (wrt $\mathcal{F}$ ): An algorithm that for each $E$-unification problem $\Gamma$ (wrt $\mathcal{F}$ ) returns success if $\Gamma$ is $E$-unifiable, and failure otherwise.
- $E$ is decidable if it admits a decision procedure.
- (Minimal) E-unification algorithm (wrt $\mathcal{F}$ ): An algorithm that computes a (minimal) finite complete set of $E$-unifiers for all $E$-unification problems over $\mathcal{F}$.

## Decision and Unification Procedures

- Decision procedure for an equational theory $E$ (wrt $\mathcal{F}$ ): An algorithm that for each $E$-unification problem $\Gamma$ (wrt $\mathcal{F}$ ) returns success if $\Gamma$ is $E$-unifiable, and failure otherwise.
- $E$ is decidable if it admits a decision procedure.
- (Minimal) E-unification algorithm (wrt $\mathcal{F}$ ): An algorithm that computes a (minimal) finite complete set of $E$-unifiers for all $E$-unification problems over $\mathcal{F}$.
- $E$-unification algorithm yields a decision procedure for $E$.

## Decision and Unification Procedures

- Decision procedure for an equational theory $E$ (wrt $\mathcal{F}$ ): An algorithm that for each $E$-unification problem $\Gamma$ (wrt $\mathcal{F}$ ) returns success if $\Gamma$ is $E$-unifiable, and failure otherwise.
- $E$ is decidable if it admits a decision procedure.
- (Minimal) E-unification algorithm (wrt $\mathcal{F}$ ): An algorithm that computes a (minimal) finite complete set of $E$-unifiers for all $E$-unification problems over $\mathcal{F}$.
- E-unification algorithm yields a decision procedure for $E$.
- (Minimal) E-unification procedure: A procedure that enumerates a possible infinite (minimal) complete set of $E$-unifiers.

## Decision and Unification Procedures

- Decision procedure for an equational theory $E$ (wrt $\mathcal{F}$ ): An algorithm that for each $E$-unification problem $\Gamma$ (wrt $\mathcal{F}$ ) returns success if $\Gamma$ is $E$-unifiable, and failure otherwise.
- $E$ is decidable if it admits a decision procedure.
- (Minimal) E-unification algorithm (wrt $\mathcal{F}$ ): An algorithm that computes a (minimal) finite complete set of $E$-unifiers for all $E$-unification problems over $\mathcal{F}$.
- E-unification algorithm yields a decision procedure for $E$.
- (Minimal) E-unification procedure: A procedure that enumerates a possible infinite (minimal) complete set of $E$-unifiers.
- E-unification procedure does not yield a decision procedure for $E$.

## Decidability wrt Kinds

Decidability of an equational theory might depend on the kinds of $E$-unification.

- There exists an equational theory for which elementary unification is decidable, but unification with constants is undecidable:
E. H.-J. Bürckert.

Some relationships between unification, restricted unification, and matching.
In J. Siekmann, editor, Proc. 8th Int. Conference on
Automated Deduction, volume 230 of LNCS. Springer, 1986.

## Single Equation vs Systems of Equations

- In syntactic unification, solving systems of equations can be reduced to solving a single equation.
- For equational unification, the same holds only for general unification.
- For elementary unification and for unification with constants it is not the case.

## Single Equation vs Systems of Equations

There exists an equational theory $E$ such that

- all elementary E-unification problems of cardinality 1 (single equations) have minimal complete sets of E-unifiers, but
- $E$ is of type zero wrt to elementary unification: There exists an elementary $E$-unification problem of cardinality that does not have a minimal complete set of unifiers.
H.-J. Bürckert, A. Herold, and M. Schmidt-Schauß.

On equational theories, unification, and decidability. J. Symbolic Computation 8(3,4), 3-49. 1989.

## Single Equation vs Systems of Equations

There exists an equational theory $E$ such that

- unifiability of elementary E-unification problems of cardinality 1 (single equations) is decidable, but
- for elementary problems of larger cardinality it is undecidable.

囯 P. Narendran and H. Otto.
Some results on equational unification.
In M. E. Stickel, editor, Proc. 10th Int. Conference on
Automated Deduction, volume 449 of LNAI. Springer, 1990.

## Three Main Questions in Unification Theory

For a given $E$, unification theory is mainly concerned with finding answers to the following three questions:
Decidability: Is it decidable whether an $E$-unification problem is solvable? If yes, what is the complexity of this decision problem?
Unification type: What is the unification type of the theory $E$ ?
Unification algorithm: How can we obtain an (efficient)
$E$-unification algorithm, or a (preferably minimal)
$E$-unification procedure?
The answers depend on whether we consider elementary unification, unification with constants, or general unification.

Results for Specific Theories

General Results

## Results for Specific Theories

General unification:

| Theory | Decidability | Type | Algorithm/Procedure |
| :--- | :---: | :---: | :---: |
| $\emptyset$ | Yes | 1 | Yes |
| A | Yes | $\infty$ | Yes |
| C | Yes | $\omega$ | Yes |
| I | Yes | $\omega$ | Yes |
| AC | Yes | $\omega$ | Yes |
| AI | Yes | 0 | $?$ |
| CI | Yes | $\omega$ | Yes |
| ACI | Yes | $\omega$ | Yes |
| AU | Yes | $\infty$ | Yes |
| AG | Yes | $\omega$ | Yes |
| CRU | No | $?(\infty$ or 0$)$ | $?$ |

CRU - Commutative ring with unit

## Example. C-Unification

- $C$-unification algorithm $\mathcal{U}_{C}$ can be obtained from the inference system $\mathcal{U}$ by adding the C -Decomposition rule:

C-Decomposition: $\left\{f\left(s_{1}, s_{2}\right) \doteq{ }_{C}^{?} f\left(t_{1}, t_{2}\right)\right\} \cup P^{\prime} ; S \Longrightarrow$

$$
\left\{s_{1} \doteq ? \stackrel{?}{C} t_{2}, s_{2} \doteq \stackrel{?}{C} t_{1}\right\} \cup P^{\prime} ; S,
$$

if $f$ is commutative.

- C-Decomposition and Decomposition transform the same system in different ways.

## Example. C-Unification

In order to C-unify $s$ and $t$ :

1. Create an initial system $\left\{s \doteq_{C}^{?} t\right\} ; \emptyset$.
2. Apply successively rules from $\mathcal{U}_{C}$, building a complete tree of derivations. C-Decomposition and Decomposition rules have to be applied concurrently and form branching points in the derivation tree.

## Example. C-Unification

$C$-unify $g(f(x, y), z)$ and $g(f(f(a, b), f(b, a)), c)$, commutative $f$.

$$
\{g(f(x, y), z) \doteq ?
$$

## Example. C-Unification

$C$-unify $g(f(x, y), z)$ and $g(f(f(a, b), f(b, a)), c)$, commutative $f$.

$$
\begin{gathered}
\left.\left\{g(f(x, y), z) \doteq{ }_{c}^{?} g(f(f(a, b), f(b, a))), c\right)\right\} ; \emptyset \\
\downarrow \\
\left\{f(x, y) \doteq{ }_{c}^{?} f(f(a, b), f(b, a)), z \doteq_{\doteq_{c}^{?}} c\right\} ; \emptyset
\end{gathered}
$$

## Example. C-Unification

C-unify $g(f(x, y), z)$ and $g(f(f(a, b), f(b, a)), c)$, commutative $f$.

$$
\begin{aligned}
&\{ \left.\left.g(f(x, y), z) \doteq{ }_{c}^{?} g(f(f(a, b), f(b, a))), c\right)\right\} ; \emptyset \\
& \downarrow \\
&\left\{f(x, y) \doteq_{c}^{?} f(f(a, b), f(b, a)), z \doteq_{c}^{?} c\right\} ; \emptyset \\
&\left\{x \doteq_{{ }_{C}}^{?} f(a, b), y \doteq_{c}^{?} f(b, a), z \doteq_{c}^{?} c\right\} ; \emptyset\left\{x \doteq_{c}^{?} f(b, a), y \doteq_{c}^{?} f(a, b), z \doteq_{c}^{?} c\right\} ; \emptyset
\end{aligned}
$$

## Example. C-Unification

$C$-unify $g(f(x, y), z)$ and $g(f(f(a, b), f(b, a)), c)$, commutative $f$.

$$
\begin{aligned}
& \left.\left\{g(f(x, y), z) \doteq{ }_{c}^{?} g(f(f(a, b), f(b, a))), c\right)\right\} ; \emptyset \\
& \left\{f(x, y) \doteq{ }_{c}^{?} f(f(a, b), f(b, a)), z \doteq{ }_{c}^{?} c\right\} ; \emptyset \\
& \left\{x \doteq{ }_{c}^{?} f(a, b), y \doteq{ }_{c}^{?} f(b, a), z \doteq{ }_{c}^{?} c\right\} ; \emptyset\left\{x \doteq{ }_{C}^{?} f(b, a), y \doteq{ }_{c}^{?} f(a, b), z \doteq{ }_{c}^{?} c\right\} ; \emptyset \\
& \left\{y \doteq{ }_{c} f(b, a), z \doteq{ }_{c} c\right\} ;\{x \doteq f(a, b)\}
\end{aligned}
$$

## Example. C-Unification

$C$-unify $g(f(x, y), z)$ and $g(f(f(a, b), f(b, a)), c)$, commutative $f$.

$$
\begin{aligned}
& \left.\left\{g(f(x, y), z) \doteq{ }_{c}^{?} g(f(f(a, b), f(b, a))), c\right)\right\} ; \emptyset \\
& \left\{f(x, y) \doteq{ }_{c}^{?} f(f(a, b), f(b, a)), z \doteq{ }_{c}^{?} c\right\} ; \emptyset \\
& \left\{x \doteq{ }_{c}^{?} f(a, b), y \doteq{ }_{c}^{?} f(b, a), z \doteq{ }_{c}^{?} c\right\} ; \emptyset\left\{x \doteq{ }_{C}^{?} f(b, a), y \doteq{ }_{c}^{?} f(a, b), z \doteq{ }_{c}^{?} c\right\} ; \emptyset \\
& \left\{y \doteq{ }_{c} f(b, a), z \doteq{ }_{c} c\right\} ;\{x \doteq f(a, b)\} \\
& \left\{z \doteq{ }_{c} c\right\} ;\{x \doteq f(a, b), y \doteq f(b, a)\}
\end{aligned}
$$

## Example. C-Unification

$C$-unify $g(f(x, y), z)$ and $g(f(f(a, b), f(b, a)), c)$, commutative $f$.

$$
\begin{aligned}

& \left\{z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(a, b), y \doteq f(b, a)\} \\
& \emptyset ;\{x \doteq f(a, b), y \doteq f(b, a), z \doteq c\}
\end{aligned}
$$

## Example. C-Unification

$C$-unify $g(f(x, y), z)$ and $g(f(f(a, b), f(b, a)), c)$, commutative $f$.

$$
\begin{aligned}
& \left.\left\{g(f(x, y), z) \doteq{ }_{c}^{?} g(f(f(a, b), f(b, a))), c\right)\right\} ; \emptyset \\
& \left\{f(x, y) \doteq{ }_{c}^{?} f(f(a, b), f(b, a)), z \doteq{ }_{C}^{?} c\right\} ; \emptyset
\end{aligned}
$$

$$
\begin{aligned}
& \left\{y \doteq{ }_{c}^{?} f(b, a), z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(a, b)\} \quad\left\{y \doteq{ }_{c}^{?} f(a, b), z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(b, a)\} \\
& \left\{z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(a, b), y \doteq f(b, a)\} \\
& \emptyset ;\{x \doteq f(a, b), y \doteq f(b, a), z \doteq c\}
\end{aligned}
$$

## Example. C-Unification

$C$-unify $g(f(x, y), z)$ and $g(f(f(a, b), f(b, a)), c)$, commutative $f$.

$$
\begin{aligned}
& \left.\left\{g(f(x, y), z) \doteq{ }_{c}^{?} g(f(f(a, b), f(b, a))), c\right)\right\} ; \emptyset \\
& \left\{f(x, y) \doteq{ }_{c}^{?} f(f(a, b), f(b, a)), z \doteq{ }_{C}^{?} c\right\} ; \emptyset
\end{aligned}
$$

$$
\begin{aligned}
& \left\{y \doteq{ }_{c} f(b, a), z \doteq{ }_{C}^{?} c\right\} ;\{x \doteq f(a, b)\} \quad\left\{y \doteq{ }_{c}^{?} f(a, b), z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(b, a)\} \\
& \left\{z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(a, b), y \doteq f(b, a)\} \quad\left\{z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(b, a), y \doteq f(a, b)\} \\
& \emptyset ;\{x \doteq f(a, b), y \doteq f(b, a), z \doteq c\}
\end{aligned}
$$

## Example. C-Unification

$C$-unify $g(f(x, y), z)$ and $g(f(f(a, b), f(b, a)), c)$, commutative $f$.

$$
\begin{aligned}
& \left.\left\{g(f(x, y), z) \doteq{ }_{c}^{?} g(f(f(a, b), f(b, a))), c\right)\right\} ; \emptyset \\
& \left\{f(x, y) \doteq{ }_{c}^{?} f(f(a, b), f(b, a)), z \doteq{ }_{c}^{?} c\right\} ; \emptyset
\end{aligned}
$$

$$
\begin{aligned}
& \left\{y \doteq{ }_{c}^{?} f(b, a), z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(a, b)\} \quad\left\{y \doteq{ }_{c}^{?} f(a, b), z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(b, a)\} \\
& \left\{z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(a, b), y \doteq f(b, a)\} \quad\left\{z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(b, a), y \doteq f(a, b)\} \\
& \emptyset ;\{x \doteq f(a, b), y \doteq f(b, a), z \doteq c\} \quad \emptyset ;\{x \doteq f(b, a), y \doteq f(a, b), z \doteq c\}
\end{aligned}
$$

## Example. C-Unification

$C$-unify $g(f(x, y), z)$ and $g(f(f(a, b), f(b, a)), c)$, commutative $f$.

$$
\begin{aligned}
& \{g(f(x, y), z) \doteq ? \bar{c} g(f(f(a, b), f(b, a))), c)\} ; \emptyset \\
& \left\{f(x, y) \doteq{ }_{c} f(f(a, b), f(b, a)), z \doteq{ }_{c}^{c} c\right\} ; \emptyset
\end{aligned}
$$

$$
\begin{aligned}
& \left\{y \doteq{ }_{c}^{?} f(b, a), z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(a, b)\} \quad\left\{y \doteq{ }_{c}^{?} f(a, b), z \doteq{ }_{c}^{?} c\right\} ;\{x \doteq f(b, a)\} \\
& \{z \doteq ? c\} ;\{x \doteq f(a, b), y \doteq f(b, a)\} \quad\left\{z \doteq \doteq_{C}^{?} c\right\} ;\{x \doteq f(b, a), y \doteq f(a, b)\} \\
& \emptyset ;\{x \doteq f(a, b), y \doteq f(b, a), z \doteq c\} \quad \emptyset ;\{x \doteq f(b, a), y \doteq f(a, b), z \doteq c\} \\
& \{\{x \mapsto f(b, a), y \mapsto f(a, b), z \mapsto c\},\{x \mapsto f(a, b), y \mapsto f(b, a), z \mapsto c\}\} \\
& \text { Not minimal. }
\end{aligned}
$$

## Example. ACU-Unification

$A C U=\{f(f(x, y), z) \approx f(x, f(y, z)), f(x, y) \approx f(y, x), f(x, e) \approx x\}$
Elementary ACU-unification problem:

$$
\Gamma=\left\{f(x, f(x, y)) \doteq ?{ }_{A C U} f(z, f(z, z))\right\}
$$

Solving idea:

1. Associate with the equation in $\Gamma$ a homogeneous linear Diophantine equation. The Diophantine equation states that the number of new variables introduced by a unifier $\sigma$ in both sides of $\Gamma \sigma$ must be the same:

$$
2 x+y=3 z
$$

(Continues on the next slide.)

## Example. ACU-Unification

Solving (Cont.):
2. Solve $2 x+y=3 z$ over nonnegative integers. Three minimal solutions:

$$
\begin{aligned}
& x=1, y=1, z=1 \\
& x=0, y=3, z=1 \\
& x=3, y=0, z=2
\end{aligned}
$$

Any other solution of the equation can be obtained as a nonnegative linear combination of these three solutions.
(Continues on the next slide.)

## Example. ACU-Unification

Solving (Cont.):
3. Introduce new variables $v_{1}, v_{2}, v_{3}$ for each solution of the Diophantine equation:

|  | $x$ | $y$ | $z$ |
| :---: | :---: | :---: | :---: |
| $v_{1}$ | 1 | 1 | 1 |
| $v_{2}$ | 0 | 3 | 1 |
| $v_{3}$ | 3 | 0 | 2 |

4. Each row corresponds to a unifier of $\Gamma$ :

$$
\begin{aligned}
& \sigma_{1}=\left\{x \mapsto v_{1}, y \mapsto v_{1}, z \mapsto v_{1}\right\} \\
& \sigma_{2}=\left\{x \mapsto e, y \mapsto f\left(v_{2}, f\left(v_{2}, v_{2}\right)\right), z \mapsto v_{2}\right\} \\
& \sigma_{3}=\left\{x \mapsto f\left(v_{3}, f\left(v_{3}, v_{3}\right)\right), y \mapsto e, z \mapsto f\left(v_{3}, v_{3}\right)\right\}
\end{aligned}
$$

However, none of them is an mgu.

## Example. ACU-Unification

## Solving (Cont.):

5. To obtain an mgu, we should combine all three solutions:

|  | $x$ | $y$ | $z$ |
| :---: | :---: | :---: | :---: |
| $v_{1}$ | 1 | 1 | 1 |
| $v_{2}$ | 0 | 3 | 1 |
| $v_{3}$ | 3 | 0 | 2 |

Looking at columns: They state that the mgu we are looking for should have

- in the binding for $x$ one $v_{1}$, zero $v_{2}$, and three $v_{3}$ 's,
- in the binding for $y$ one $v_{1}$, three $v_{2}$ 's, and zero $v_{3}$,
- in the binding for $z$ one $v_{1}$, one $v_{2}$, and two $v_{3}$ 's

6. Hence, we can construct the mgu:

$$
\begin{aligned}
\sigma=\{x & \mapsto f\left(v_{1}, f\left(v_{3}, f\left(v_{3}, v_{3}\right)\right), y \mapsto f\left(v_{1}, f\left(v_{2}, f\left(v_{2}, v_{2}\right)\right),\right.\right. \\
& \left.z \mapsto f\left(v_{1}, f\left(v_{2}, f\left(v_{3}, v_{3}\right)\right)\right)\right\}
\end{aligned}
$$

## Example. ACU-Unification

## Exercise.

Verify that the unifiers $\sigma_{1}, \sigma_{2}$ and $\sigma_{3}$ are instances of $\sigma$.

## Example. E-Unification of Type 0

## Example

- Equational theory: $E=\{f(e, x) \approx x, g(f(x, y)) \approx g(y)\}$.
- E-unification problem: $\Gamma=\{g(x) \doteq \stackrel{?}{E} g(e)\}$.

## Example. E-Unification of Type 0

## Example

- Equational theory: $E=\{f(e, x) \approx x, g(f(x, y)) \approx g(y)\}$.
- $E$-unification problem: $\Gamma=\{g(x) \doteq ? \stackrel{?}{E} g(e)\}$.
- Complete (why?) set of solutions:

$$
\begin{aligned}
\sigma_{0} & =\{x \mapsto e\} \\
\sigma_{1} & =\left\{x \mapsto f\left(x_{0}, e\right)\right\} \\
\sigma_{2} & =\left\{x \mapsto f\left(x_{1}, f\left(x_{0}, e\right)\right)\right\} \\
& \ldots \\
\sigma_{n} & =\left\{x \mapsto f\left(x_{n-1}, x \sigma_{n-1}\right)\right\}
\end{aligned}
$$

## Example. E-Unification of Type 0

## Example

- Equational theory: $E=\{f(e, x) \approx x, g(f(x, y)) \approx g(y)\}$.
- E-unification problem: $\Gamma=\{g(x) \doteq ? \stackrel{?}{E} g(e)\}$.
- Complete (why?) set of solutions:

$$
\begin{aligned}
\sigma_{0} & =\{x \mapsto e\} \\
\sigma_{1} & =\left\{x \mapsto f\left(x_{0}, e\right)\right\} \\
\sigma_{2} & =\left\{x \mapsto f\left(x_{1}, f\left(x_{0}, e\right)\right)\right\} \\
& \ldots \\
\sigma_{n} & =\left\{x \mapsto f\left(x_{n-1}, x \sigma_{n-1}\right)\right\}
\end{aligned}
$$

- No mcsu. $\sigma_{i}={ }_{E}^{\{x\}} \sigma_{i+1}\left\{x_{i} \mapsto e\right\} . \sigma_{i} \mathbb{Z}_{E}^{\{x\}} \sigma_{j}$ for $i>j$. Infinite descending chain: $\sigma_{0}>{ }_{E}^{\{x\}} \sigma_{1}>\left\{\begin{array}{l}\{x\} \\ \sigma_{2}\end{array}{\underset{E}{\{x\}} \ldots}^{\{ }\right.$

## Example. E-Unification of Type 0

Example (Cont.)
Why does $\left.\left.\sigma_{0}\right\rangle_{E}^{\{x\}} \sigma_{1}>{ }_{E}^{\{x\}} \sigma_{2}\right\rangle_{E}^{\{x\}} \cdots$ imply that there is no mcsu?

- Let $S=\left\{\sigma_{0}, \sigma_{1}, \ldots\right\}$.

## Example. E-Unification of Type 0

## Example (Cont.)

Why does $\left.\left.\sigma_{0}\right\rangle_{E}^{\{x\}} \sigma_{1}>{ }_{E}^{\{x\}} \sigma_{2}\right\rangle_{E}^{\{x\}} \cdots$ imply that there is no mcsu?

- Let $S=\left\{\sigma_{0}, \sigma_{1}, \ldots\right\}$.
- Let $S^{\prime}$ be an arbitrary complete set of unifiers of $\Gamma$.

## Example. E-Unification of Type 0

## Example (Cont.)

Why does $\left.\left.\sigma_{0}\right\rangle_{E}^{\{x\}} \sigma_{1}>{ }_{E}^{\{x\}} \sigma_{2}\right\rangle_{E}^{\{x\}} \ldots$ imply that there is no mcsu?

- Let $S=\left\{\sigma_{0}, \sigma_{1}, \ldots\right\}$.
- Let $S^{\prime}$ be an arbitrary complete set of unifiers of $\Gamma$.
- Since $S$ is complete, for any $\vartheta \in S^{\prime}$ there exists $\sigma_{i} \in S$ such that $\sigma_{i} \stackrel{⿺}{E}_{\{x\}} \vartheta$.

## Example. E-Unification of Type 0

## Example (Cont.)

Why does $\left.\left.\sigma_{0}\right\rangle_{E}^{\{x\}} \sigma_{1}>{ }_{E}^{\{x\}} \sigma_{2}\right\rangle_{E}^{\{x\}} \ldots$ imply that there is no mcsu?

- Let $S=\left\{\sigma_{0}, \sigma_{1}, \ldots\right\}$.
- Let $S^{\prime}$ be an arbitrary complete set of unifiers of $\Gamma$.
- Since $S$ is complete, for any $\vartheta \in S^{\prime}$ there exists $\sigma_{i} \in S$ such that $\sigma_{i}{\underset{E}{E}}_{\stackrel{\{x\}}{x\}}} \vartheta$.
- Since $\sigma_{i+1}<_{E}^{\{x\}} \sigma_{i}$, we get $\sigma_{i+1}<_{E}^{\{x\}} \vartheta$.

## Example. E-Unification of Type 0

## Example (Cont.)

Why does $\left.\left.\sigma_{0}\right\rangle_{E}^{\{x\}} \sigma_{1}>{ }_{E}^{\{x\}} \sigma_{2}\right\rangle_{E}^{\{x\}} \ldots$ imply that there is no mcsu?

- Let $S=\left\{\sigma_{0}, \sigma_{1}, \ldots\right\}$.
- Let $S^{\prime}$ be an arbitrary complete set of unifiers of $\Gamma$.
- Since $S$ is complete, for any $\vartheta \in S^{\prime}$ there exists $\sigma_{i} \in S$ such that $\sigma_{i} \leq_{E}^{\{x\}} \vartheta$.
- Since $\sigma_{i+1}<_{E}^{\{x\}} \sigma_{i}$, we get $\sigma_{i+1}<_{E}^{\{x\}} \vartheta$.
- On the other hand, since $S^{\prime}$ is complete, there exists $\eta \in S^{\prime}$ such that $\eta{\underset{E}{E}}_{\{x\}} \sigma_{i+1}$.

## Example. E-Unification of Type 0

## Example (Cont.)

Why does $\sigma_{0}>_{E}^{\{x\}} \sigma_{1}>_{E}^{\{x\}} \sigma_{2}>_{E}^{\{x\}} \ldots$ imply that there is no mcsu?

- Let $S=\left\{\sigma_{0}, \sigma_{1}, \ldots\right\}$.
- Let $S^{\prime}$ be an arbitrary complete set of unifiers of $\Gamma$.
- Since $S$ is complete, for any $\vartheta \in S^{\prime}$ there exists $\sigma_{i} \in S$ such that $\sigma_{i}<_{E}^{\{x\}} \vartheta$.
- Since $\sigma_{i+1}<_{E}^{\{x\}} \sigma_{i}$, we get $\sigma_{i+1}<_{E}^{\{x\}} \vartheta$.
- On the other hand, since $S^{\prime}$ is complete, there exists $\eta \in S^{\prime}$ such that $\eta \leq_{E}^{\{x\}} \sigma_{i+1}$.
- Hence, $\eta \lessdot_{E}^{\{x\}} \vartheta$ which implies that $S^{\prime}$ is not minimal.

## Specific vs General Results

For each specific equational theory separately studying

- decidability,
- unification type,
- unification algorithm/procedure.

Can one study these problems for bigger classes of equational theories?

## Outline

Motivation<br>\title{ Equational Theories，Reformulations of Notions }<br>\section*{Unification Type，Kinds of Unification}<br>\section*{Results for Specific Theories}

General Results

## General Results

In general, unification modulo equational theories

- is undecidable,
- unification type of a given theory is undecidable,
- admits a complete unification procedure (Gallier \& Snyder, called an universal $E$-unification procedure).

## General Results

Universal $E$-unification procedure $\mathcal{U}_{E}$.
Rules:

- Trivial, Orient, Decomposition, Variable Elimination from $\mathcal{U}$, plus
- Lazy Paramodulation:

$$
\{e[u]\} \cup P^{\prime} ; S \Longrightarrow\left\{I \doteq^{?} u, e[r]\right\} \cup P^{\prime} ; S,
$$

for a fresh variant of the identity $I \approx r$ from $E \cup E^{-1}$, where

- $e[u]$ is an equation where the term $u$ occurs,
- $u$ is not a variable,
- if / is not a variable, then the top symbol of / and $u$ are the same.

## General Results

Universal $E$-unification procedure. Control.
In order to solve a unification problem $\Gamma$ modulo a given $E$ :

- Create an initial system 「; $\emptyset$.
- Apply successively rules from $\mathcal{U}_{E}$, building a complete tree of derivations.
- No other inference rule may be applied to the equation $I \doteq$ ? $u$ that is generated by the Lazy Paramodulation rule before it is subjected to a Decomposition step.

## General Results

Universal $E$-unification procedure.
Example
$E=\{f(a, b) \approx a, a \approx b\}$.
Unification problem: $\left\{f(x, x) \doteq{ }_{E}^{?} x\right\}$.
Computing a unifier $\{x \mapsto a\}$ by the universal procedure:

$$
\begin{aligned}
& \left\{f(x, x) \doteq{ }_{E}^{?} x\right\} ; \emptyset \Longrightarrow L P\{f(a, b) \doteq \stackrel{?}{E} f(x, x), a \doteq ? \stackrel{?}{=} x\} ; \emptyset \\
& \Longrightarrow_{D}\{a \doteq ?
\end{aligned}
$$

$$
\begin{aligned}
& \Longrightarrow s\left\{b \doteq{ }_{E}^{?} a, a \doteq{ }_{E}^{?} a\right\} ;\{x \doteq a\} \\
& \Longrightarrow L P\left\{a \doteq{ }_{E}^{?} a, b \doteq \begin{array}{l}
? \\
E
\end{array}, a \doteq \doteq_{E}^{?} a\right\} ;\{x \doteq a\} \\
& \Longrightarrow{ }_{T}^{+} \emptyset ;\{x \doteq a\}
\end{aligned}
$$

## General Results

Pros and cons of the universal procedure:

- Pros: Is sound and complete. Can be used for any $E$.
- Cons: Very inefficient. Usually does not yield a decision procedure or a (minimal) E-unification algorithm even for unitary or finitary theories with decidable unification.

## General Results

More useful results can be obtained by imposing additional restrictions on equational theories:

- Syntactic approaches: Restricting syntactic form of the identities defining equational theories.
- Semantic approaches: Depend on properties of the free algebras defined by the equational theory.
